Comply iV (CiV)

Handover Summary

What the system does and how it works, in short

23 October 2026 · a short guide to what the system does and how it works. The full detail is in the CiV System Specification.

1. What CiV is, in one minute

CiV is an **independent TCPA compliance audit system** for companies that call and text people for marketing (call centers, sellers, lead buyers). It connects **read-only** to the tools a company already uses, reads **every call and text**, and checks each one against a written set of US rules (the **Rulebook**).

It gives the company, every day and every month:

What	In plain words
Proof per contact	For every number: was there consent, was a "stop" honoured in time, was it inside calling hours, where did the number come from
Scores	An Audit Score (how compliant) and an Exposure Indicator (how likely and costly a lawsuit is)
Findings and alerts	Problems written in plain words, with what to fix first
Evidence	Sealed, fingerprinted records that can be exported for a lawyer, a court or an insurer
Insurer sharing	A monthly risk sheet the company can share with its insurer or a buyer

CiV **measures and records**. It never makes calls, never blocks anything and gives no legal advice.

2. Who uses it

Who	Where	What they can do
Client Admin	Client portal	Everything for their company: invites the team, changes roles, connects and uploads, shares with insurers, Settings, Users & Access
Client lawyer (a Member or Admin with the lawyer tick)	Client portal	Everything a Member sees, plus reviews new laws and rule drafts and suggests law changes; signs statements, decides findings, exports evidence
Client Member	Client portal	Sees every page (except Settings and Users & Access); cannot change people, settings or evidence
Insurer / acquirer	Insurer view of the portal	Sees only the companies that share with them: portfolio, exposure, risk sheet, litigation figures
CiV staff	CiV admin panel	Onboards clients, approves rule changes, checks proof files, manages insurers, sends password links

Every client user has their own **"View as" switch**: *Owner* (their portal) or *Underwriter* (their own company exactly as their insurer sees it).

3. How it works, start to finish

1. **Onboarding:** CiV creates the client with its Admin's name and email. The Admin gets an **invitation link**, chooses a password, and invites the team.
2. **Connecting tools:** CiV saves a **read-only key** for each tool (dialer, texting, CRM, consent certificates). Keys are locked away and never shown again.
3. **Reading:** every **2 minutes** CiV asks each tool for new calls, texts and records. Phone numbers are turned into **private codes** at once; CiV **never stores a phone number**.
4. **Uploads:** what a tool can't give by API comes in through the **Upload centre** (do-not-call lists, DNC check records, complaints, policies, vendor lead files, vendor contracts).
5. **Fingerprints and daily seal:** every record gets a fingerprint; every night the day's fingerprints are **sealed and time-stamped**, so any later change would show.
6. **Checking:** each contact is checked for consent, certificates, consent page wording, lead source, opt-outs and the 10-business-day deadline, calling hours, frequency, and do-not-call lists.
7. **Scoring:** every night the metrics are worked out; every month a snapshot is saved (scores, factors, Exposure).
8. **Findings, alerts, reports:** problems appear in plain words; alerts show in the portal (and by email to Admins if they choose); monthly reports are made on the 6th.
9. **Sharing:** each night a **risk sheet** is saved; an insurer the company shares with sees it, and can have it sent to its own pricing software.
10. **Keeping the rules current:** a **law watcher** reads new US federal rules every morning; CiV drafts Rulebook changes, the clients' lawyers review them, CiV approves them.

4. The 16 modules

#	Module	What it does
1	Data foundation	Background workers, private phone codes, fingerprints, nightly seal, each company's data locked apart
2	Rulebook	Every rule written as data, with versions and per-state values
3	Connectors	Read-only links to tools, read every 2 minutes
4	Normaliser	Turns every tool's records into one standard "contact"
5	Imports and completeness	Groups imports; checks CiV was given all records
6	Consent engine	Gives each contact a consent result with a reason
7	Certificates and page photos	Claims consent certificates; photographs consent web pages
8	Lead source	Traces where each number came from; asks the client for missing proof
9	Opt-outs and AI review	Tracks every "stop" and its deadline; AI reads texts and calls (switched off until an AI is chosen)
10	Metrics and scoring	The metrics, Audit Score and Exposure Indicator
11	Findings, alerts, reports	Problems, alerts and PDF reports
12	Vendor scorecard	Scores each lead vendor monthly; contracts and return requests
13	Rule changes and law watcher	New laws found, lawyer review, CiV approval
14	Evidence vault	Evidence per number, re-checks at the source, sealed exports, legal holds
15	Insurer views	Sharing, signed statements, risk sheets, insurer pages, sending to insurer software
16	Document AI	Readers for contracts, consent pages and policy files (switched off until an AI is chosen)

5. The client portal, page by page

Page	What the client sees and does
Overview	The score, what to fix first, recent alerts
Audit Scorecard	The score by area and the six risk factors
Action Queue	Findings to fix: assign, set a due date, record a decision
Alerts	New problems, sorted by how serious; mark as reviewed
Consent Integrity	Consent results, certificates, consent page photos
Contact Ledger	Every call and text (numbers masked)
Revocation Integrity	Every opt-out, its deadline, and whether each tool honoured it
Who You Contact	Do-not-call, internal list, reassigned numbers, litigators
Evidence Vault	Look up a number on a date, verify a file (is it untouched?), legal holds
Contact Conduct	Calling hours, frequency, robocalls
Lead Provenance	Where numbers came from; answer CiV's proof requests
Vendor Ledger	Vendor scores, contracts, leads that can be returned
Source Registry	Connected tools and the Upload centre
Reports & Exports	Download the monthly audit report, other reports, bulk evidence export
Rulebook / Regulatory Changes	The rules in use; new laws (the lawyer reviews them)
Shared with your insurer	Data Integrity, Risk Attestation (sign statements), Underwriting Export
Setup & Readiness	Can the audit start; the setup checklist (Admin ticks)
Settings *(Admin)*	Company facts, alert emails, plan and usage, agreements, insurer sharing
Users & Access *(Admin)*	Invite people (lawyer tick box), roles, resend or cancel invites, access log
My account *(everyone)*	Change your own password

Anything CiV does not measure yet says **"Not measured"**, never a made-up number.

6. Users, logins and safety

- **Joining:** everyone joins by an **invitation link** (one use, 7 days) and chooses their own password. Nobody ever types a password for someone else.
- **Passwords:** at least 12 characters, not a common one, stored scrambled (Argon2). Change your own in **My account**. Forgot it? CiV staff send a **password link**; there is no self-service "Forgot password".
- **Lockout:** 5 wrong passwords in 15 minutes locks that email for 15 minutes, on the portal and on the CiV panel.
- **Company walls:** each company's data is locked apart **in the database itself**; no company can ever see another's.
- **No phone numbers stored:** only private codes and masked labels like (916) •••-0142.
- **Files:** private, every opening logged, kept 4 years, then deleted (their fingerprints stay); legal holds stop deletion.
- **Access log:** every sign-in, view, export and change is recorded and can't be edited.
- **Tools:** read-only; CiV never changes anything in the client's tools.

7. Scores in short

- Each metric becomes a score from 0 to 100.
- The metrics roll up into **six risk factors** (consent, suppression, opt-outs, calling conduct, lead sources, call integrity).
- **Exposure Indicator** = how much is wrong × pressure from where they call, who targets them and how much they call. Grades **A** (lowest risk) to **F**.
- A grade is capped when too little of it rests on real evidence, so a company can't look good by sharing nothing.

8. Insurers

- The client's Admin shares from **Settings** → **Insurer sharing** (insurer or acquirer, optional end date) and can stop at any time.
- The insurer gets an invitation, or an email "now shares with you" if they already have an account.
- They see the company's monthly risk sheet, data integrity and exposure; **never** contacts, numbers, findings or notes.
- The company can sign **statements** for its insurer; statements never raise a score, and CiV shows any conflict with what it measured.
- An insurer can save its own pricing software's address and key and have each month's sheet **sent automatically**, signed so they can check it came from CiV unchanged.

9. The CiV staff panel

- **Clients:** create a client (with its Admin), stages, contract, documents, connections (time zone picked from a list), users, invites (Resend), onboarding checklist.
- **Insurers:** people (password link, turn off, delete), waiting invites (Resend, Cancel), companies sharing (Stop sharing), block or delete an insurer.
- **Rules:** Rulebook with each rule's history, Rulebook check, regulatory changes (approve rule updates, delete drafts), new law items, client suggestions.
- **AI:** AI answers to approve, exam results, extra exam questions.
- **Team:** CiV staff (added by name and email; welcome link; full access for now).
- **Records:** access log, client reports (download), failed-job cleanups, missed records.

10. What the client provides, and what comes next

The client provides: read-only keys for their tools (or clicks "Allow"), the upload files a tool can't give, and their lawyer's review of draft rules.

To switch on:

- **Email sending:** the Gmail login goes into the server settings; until then invitations, password links and alert emails are not delivered.
- **AI:** the AI for conversation review, call transcription and document reading is chosen later; until then those parts are switched off and nothing is sent anywhere.

Planned later: per-person permissions for CiV staff; more tool connectors as clients need them; more state laws and court data.
